One day, when utilizing the SMT solver, my colleague who concentrates on static analysis asked: Why is the solution obtained by the SMT solver difficult to understand (too large, too small, or not realistic), especially for practical instances? I think it is an interesting question, and our preliminary answer is to introduce probability distribution into the SMT-solving process.

A Simple Example							

void HealthCare(double weight, double height){
 BMI = weight / (height * height);
 if(BMI >= 18.5 && BMI <= 24.9) {...} // healthy
 else {...} // treatment suggestion
}</pre>

Path Condition: $18.5 \leq \frac{w}{h^2} \leq 24.9 \Longrightarrow$ healthy.

An SMT solver finds an assignment for *healthy* = \top , w = 0.375, h = 0.125, which is correct but not real. In practice, such variables usually obey some distributions, for example, $w \sim N(60, 10)$, $h \sim N(1.7, 0.1)$. Our algorithm can obtain an assignment w = 66.82, h = 1.75 on the distributions.

- We introduce the probability distribution into SMT and define it as the PSMT problem. It allows the variables in solutions to satisfy certain probability distributions.
- We construct the Prob-MCSAT algorithm, combining probability distribution and conflict-driven process.
- **3** Given distributions for variables, Prob-MCSAT can generate a plausible solution that is closer to reality.

 Satisfiability Modulo theories (SMT) is an area of automated deduction that studies methods for checking the satisfiability of first-order formulas with respect to some logical theory T of interest [1, 2].

- It has many applications in probabilistic program analysis [3], stochastic hybrid systems [4] and etc.
- Most of the works concentrate on the probability that the constraints are satisfied [5].
- Recent work on SMT sampling [6] approximates sample points by adding extra constraints after the solver obtains a solution.
- It seems an unexplored area that solves an SMT problem with probability for variables.

Definition 1 (Domain under Constraint)

Given a constraint ψ and variable x, the domain under constraint $D(\psi, x)$ is the domain of x where when assigning x any value in $D(\psi, x)$, there exists a full assignment satisfying ψ .

Definition 2 (Distribution under Constraint)

Given a constraint ψ and a distribution for variable x, whose probability density function is $P(x), x \in \mathbb{R}$, the distribution of xunder constraint ψ is a refined distribution whose probability density function is $\widetilde{P}(\psi, x)$,

$$\widetilde{P}(\psi, x) = \begin{cases} \frac{1}{\int_{D(\psi, x)} P(x) dx} P(x), x \in D(\psi, x), \\ 0, x \in \mathbb{R} - D(\psi, x). \end{cases}$$

Definition 3 (Probability Satisfiability Modulo Theories)

Given an *n* variable SMT constraint ψ , a value distribution *P*, and a variable order σ , find an assignment $\alpha \models \psi$, i.e., α satisfies ψ . Meanwhile, the *i*-th variable *x* follows distribution under constraint, i.e., $\alpha[x_i] \sim \widetilde{P}(\psi(\{\alpha[x_{\sigma_1}], \dots, \alpha[x_{\sigma_{i-1}}]\}), x_i))$ where $1 \le i \le n$.

- Given a constraint $\psi = \{-2 \le x \le 2 \land x^2 + y \ge 1\}$, and x follows a uniform distribution in [-2, 2], i.e., U([-2, 2]).
- If a partial assignment is $\alpha = \{y \leftarrow 0\}$, then we have $\psi(\alpha) = -2 \le x \le 2 \land x^2 \ge 1$.
- Domain under Constraint for x:

$$D(\psi(\alpha), x) = [-2, -1] \cup [1, 2].$$

• Distribution under Constraint for x:

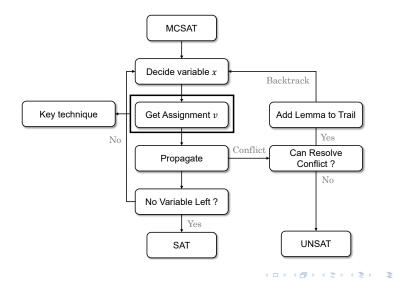

$$\widetilde{P}(\psi(\alpha), x) = \frac{1}{\int_{-2}^{-1} \frac{1}{4} dx + \int_{1}^{2} \frac{1}{4} dx} P(x) = 2P(x) = \frac{1}{2},$$

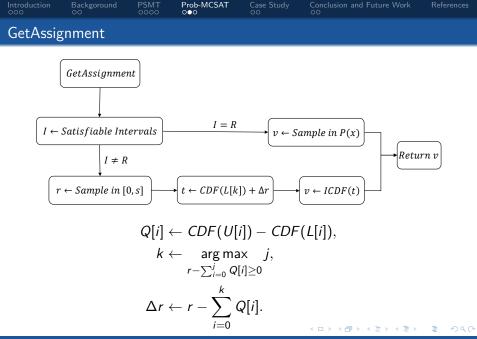

where $x \in D(\psi(\alpha), x)$.

• Sample under the distribution and find an assignment $\{x \leftarrow v, y \leftarrow 0\}$ can be a solution to the PSMT problem.

In this work in progress, we initially proposed PSMT and designed an algorithm, Prob-MCSAT. The visualized examples show that Prob-MCSAT can produce a clear trend in the satisfiable space. There are several future works that should be explored:

- Extending and refining the definition of PSMT;
- Identifying realistic applications for PSMT;
- Exploring distributions to enhance SMT solving speed;
- Utilizing Prob-MCSAT solutions for testing and teaching;
- Considering the bias in SMT solver solutions.
